

Devices, systems and processes for accessing and management of voice and other messages. Such devices, systems and processes employ an interface which allows the user to access and manage messages on his or her user device and, furthermore, automatically to access and manage messages on remote devices via radio frequency link. These interfaces may present users with intuitive and direct options for accessing and managing voice mail, such as, for instance, to push a designated forward button when the user desires to forward a voice mail. Such common interfaces promote more efficient and effective use and management of messaging resources because they among other things eliminate the requirement to be conversant in different interfaces, rules and protocols for the different platforms on which messages may be accessed and managed.
